

DES No. 22 of 2013

**PROJECTED POPULATION OF KARNATAKA
2012-2021**

(PROVISIONAL)

**Issued by:
Directorate of Economics and Statistics
Bangalore
2013**

PREFACE

The population census provides information on population and its other characteristics. The census being a decennial exercise does not provide the measure of population change from year to year. The measures of fertility and mortality derived from the census are centered on the mid-point of the decade and as such do not provide any change. Population is one of the most important items for which projections are often made. Though projections may not turn to be precise, they are indicative of the future trends and are useful to the demographers, administrators, planners and to the public at large in different ways. Projections of future populations are also required for preparation of five year plans. Academically also these forecasts are of invaluable utility.

With this backdrop an attempt has been made to project the Provisional Population in Karnataka by districts and taluks for rural and urban units separately upto the year 2021. In this attempt only towns with a population of one lakh and above have been covered. These projections are based on the Geometric growth rates between 2001 and 2011 censuses.

This exercise was carried out by Civil Registration & National Sample Survey Division of this Directorate. The efforts of Staff/Officers in bringing out this report is very much appreciated.

Suggestions, if any for the improvement are most welcome.

Date: 18.02.2013

CONTENTS

- 1. Population projections for Karnataka 2012-2021- an introductory note.**
- 2. District wise and Sector wise male & female Population-2011(Provisional)**
- 3. Decadal variation in population, 1901-2011.**
- 4. District wise and Sector wise male & female Growth rate**
- 5. Projected population – District wise**
- 6. Projected population - District and Taluk wise - Rural and Urban.**

POPULATION PROJECTION FOR KARNATAKA 2012 – 2021

1. INTRODUCTION

Planning process whether for development or administration or service is unthinkable without one or the other kind of population statistics. The practice of population count was prevalent even in the olden days in some form or other, in order to provide to the rulers a sound footing for administration. In India, the decennial head count or population census was launched in 1871 by the then British administration and ever since, these operations have witnessed history of more than a century. In view of the gigantic task involved in the process, in terms of men, material and money, the population census is taken decennially. For the intercensal period, interpolation techniques fill the gap. A fairly acceptable notion of the size of population for the years much ahead is absolutely necessary in the context of planned development, regulation of population growth and formulation of population policy. There are many factors influencing the demographic behaviour of a society viz., birth rate, death rate, fertility rate, migration and the like. Absence of these vital rates/data, that too for taluks/districts, render working out population projections with a high degree of precision, difficult.

2. UTILITY OF POPULATION PROJECTIONS.

To meet the full range of planning needs most efficiently population projections are required for taluka as well as district levels. For a State like Karnataka which is in the forefront of administrative reforms, in the form of Gram Panchayat System, population projection would go a long way in efficient (a) block level planning (b) decision making (c) development programme formulation (d) family planning/welfare programme (e) immunisation programme etc.

3. METHOD OF PROJECTION

In this paper, of the three methods, viz., mathematical, component and ratio, the mathematical method/model has been followed. Within this, the specific method followed is the Geometrical one. The distinguishing feature of the mathematical model is the employment of past trends, besides simplicity in calculation. These mathematical models are particularly useful when information on vital rates on birth, death, fertility, mortality, migration etc., at micro level are inadequate/not available. These models are widely used.

The projections have been arrived at for rural and urban areas of each taluk separately, using the corresponding 2001-2011 growth rates of respective districts. These have been further aggregated to district and State population.

The mathematical formula used for calculating growth rate is :

$$P = P_0(1+r)^t$$

$$P/ P_0 = (1+r)^t$$

$$\frac{\text{Log}_{10} (P/ P_0)}{t} = \text{Log}_{10} [1+r]$$

$$10^x = [1+r] , \quad \text{where, } x = \frac{\text{Log}_{10} (P/ P_0)}{t}$$

$$r = [10^x] - 1$$

Where,

P = Provisional Population of 2011 census.

P₀ = Population of 2001 census.

t = 10 years

r = Growth rate.(The growth rate is the rate at which a population is increasing(or decreasing) in a given year.)

4 . LIMITAIONS OF THE POPULATION PROJECTIONS

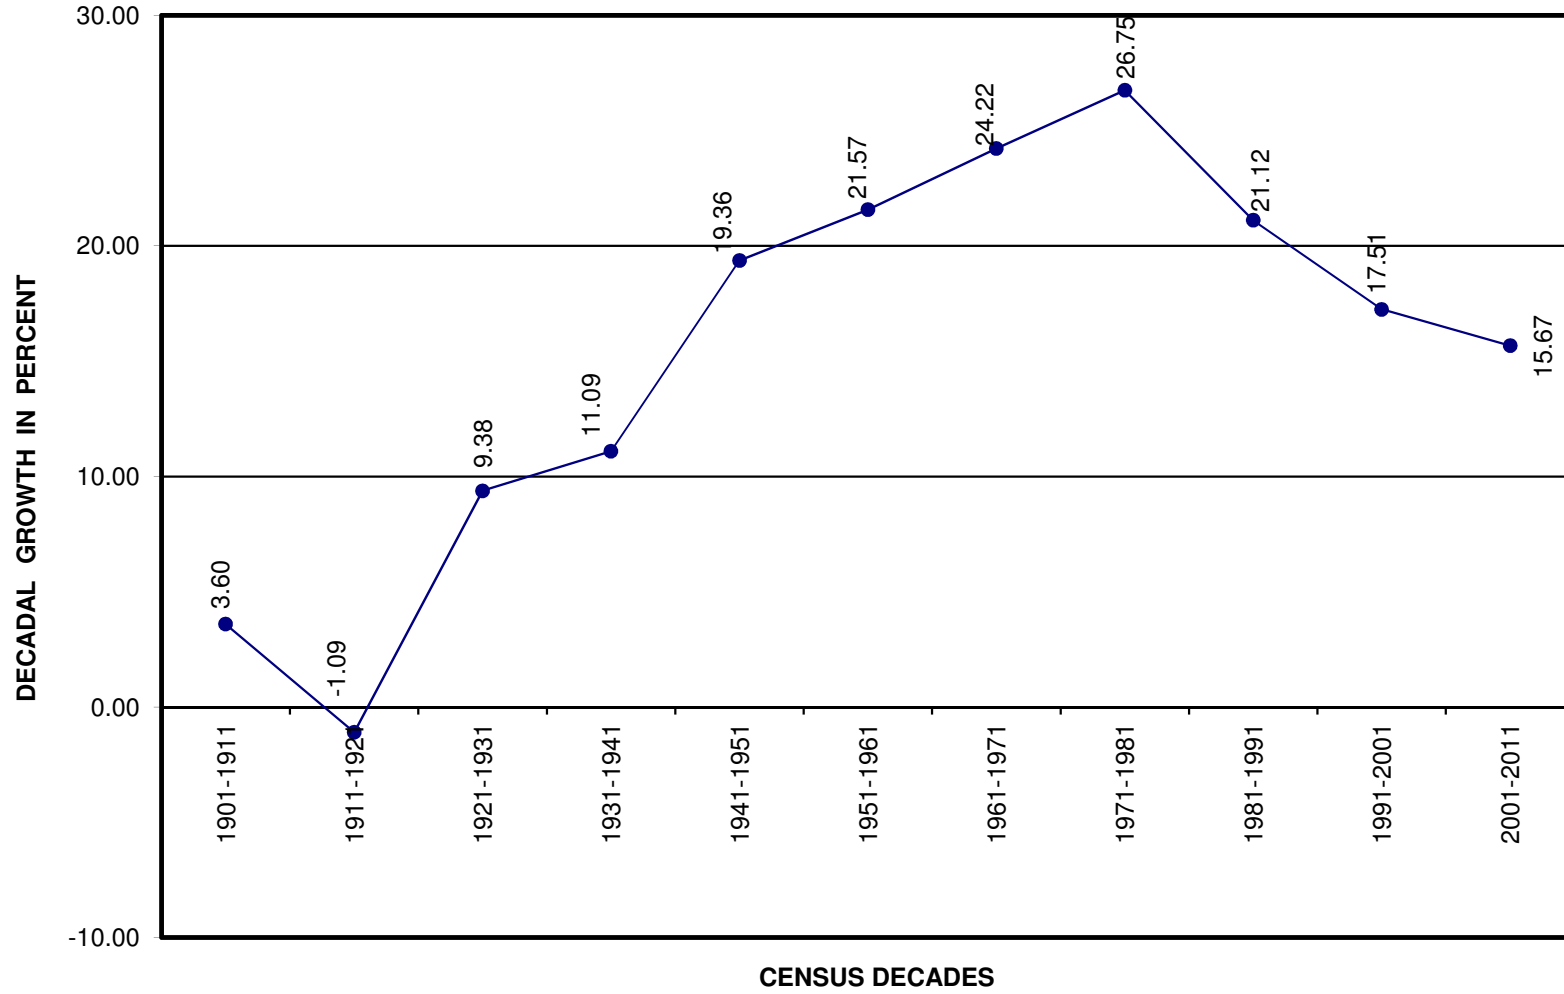

Projections are based on the assumption that demographic behaviour of the society or trends in population growth would remain more or less the same in the coming decade as in the past(2001-2011). It is for this reason that projections have an inherent degree of error as in the case of other forecasts.

DISTRICTWISE AND SECTORWISE MALE & FEMALE POPULATION-2011

[PROVISIONAL]

| DISTRICT NAME | RURAL | | | URBAN | | | TOTAL | | |
